### compiling client and server

Created by Jun Yeong Yang on Jul 14, 2014 4:18 PM

our current Makefile not only compiles librpc.a and binder, but it also compiles server and client that were provided as an example.

Should we allow the Makefile to compile client and server if possible, or should we not?

We would **greatly** appreciate it if your default target only compiles the library. We have our own Makefile that uses your library, and compiles its own clients/servers.

That being said, as long as everything is documented properly in the README / manual, and your Makefile can correctly build a library, you won't lose marks for how you structure it.

You will lose marks if we type 'make' and it fails to compile binder and librpc.a. This will likely happen because our client and server code is not necessarily named the same as the sample code provided.
